

ECOLOGY PRODUCTS

5.1 PRODUCTS OFFERED

Ecology is striving to develop an "Environmental Series" of roofing products which meet VOC, landfill and other safety standards requirements. This specification manual addresses the Modified Bitumen and Built-up Roofing Systems offered by Ecology Roof Systems®. The specifications include several alternative system designs for Ecology materials.

While Ecology is attempting to bring environmentally safe products and systems into the roofing market, regulations may vary with different local or state authorities and landfill sites. The specification writer should be knowledgeable of these required standards in determining the proper system selection.

Some of the product categories listed in these specifications include:

SBS (Styrene Butadiene Styrene), and SEBS (Styrene Ethylene Butadiene Styrene), modified bitumen membranes, fiberglass and polyester felts, self-adhered felts and cap membranes, hot application rubberized and conventional asphalts, cold application primers, bonding cements, cold application adhesives, and specialized coatings for use with the products offered.

Any substitution of Ecology materials for other non-Ecology products must be pre-approved in writing by an authorized representative of Ecology Roof Systems®.

Further information on the products offered by Ecology can be found in the individual product pages included in this manual.
